Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NADPH-ferrihemoprotein reductase (EC 1.6.2.4) - Aspergillus niger
N;Alternate names: NADPH-cytochrome P450 oxidoreductase
C;Species: Aspergillus niger
C;Species: Aspergillus niger
C;Accession: S38427
R;van den Brink, J.; van Zeijl, C.; van den Hondel, C.; van Gorcom, R.
submitted to the EMBL Data Library, October 1993
A;Description: Cloning and characterization of the NADPH cytochrome P450 oxidoreducta
A;Accession: S38427
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A; Introns: 595/3
C;Superfamily: NADPH-ferrihemoprotein reductase; flavodoxin homology; NADPH-ferrihemo
C;Keywords: flavoprotein; NADP; oxidoreductase
F;66-691/Domain: NADPH-ferrihemoprotein reductase homology <FEH>

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. SwissProt\_40:\* Database :

-!- FUNCTION: FUNCTIONS AS A FATTY ACID MONOOXYGENASE. CATALYSES HYDROXYLATION OF MEDIUM AND LONG-CHAIN FATTY ACIDS AT OMEGA-1, OMEGA-2 AND OMEGA-3 POSITIONS, WITH OPTIMUM CHAIN LENGTHS OF 14-16 CARBONS (LAURIC, MXRISTIC, AND PALMITIC ACIDS). THE REDUCTASE DOMAIN IS REQUIRED FOR ELECTRON TRANSFER FROM NADP TO CYTOCHROME
                                                                                                                                                                                                                                                                                                                                                                                 R InterPro; IPR001308; Cytochrome_P450.

         functional expression in yeast.";
Blochim. Blophys. Acta 1186:137-141(1994).
-!- FUNCTION: THIS ENIXME IS REQUIRED FOR ELECTRON TRANSFER FROM NADP
TO CYTOCHROME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON
TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.
-!- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome = NADP(+) + 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

J. 236:871-878(1986).
-1- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NADP
TO STOCHOME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON
TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PRINTS; PR00369; FLAVODOXIN.

Biol. Chem. 257:5929-5938(1982).

-I- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NADP TO CYTOCHROME PASO IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.

-I- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome = NADP(+) + 2
                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM. ANCHORED TO THE ER MEMBRANE BY ITS N-TERMINAL HYDROPHOBIC REGION.
SIMILARITY: THE FMN-BINDING DOMAIN IS RELATED TO BACTERIAL FLAVODOXINS. THE FAD DOMAIN APPEARS HOMOLOGOUS WITH FERREDOXIN NADP+ REDUCTASE, NADH CYTOCHROME B5 REDUCTASE, AND GLUTATHIONE REDUCTASE.

-1- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM N.
TO CYTOCHROWE P450 IN MACROSOMES. IT CAN ALSO PROVIDE ELECTRON
TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.
-1- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome = NADP(+) + 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i- SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM. ANCHORED TO THE ER MEMBRANE BY ITS N-TERMINAL HYDROPHOBIC REGION.
-i- SIMILARITY: THE FMN-BINDING DOMAIN IS RELATED TO BACTERIAL FLAVODOXINS. THE FAD DOMAIN APPEARS HOMOLOGGOUS WITH FERREDOXIN NADP+ REDUCTASE, NADH CYTOCHROME B5 REDUCTASE, AND GLUTATHIONE REDUCTASE.

                                                                                                                                                                                -I-TISSUE SPECIFICITY: WIDELY EXPRESSED IN THE NERVOUS SYSTEM:
EXPRESSED IN CEREBRUM, OLFACTORY BULB, HIPPOCAMPUS, MIDBRAIN,
CEREBELLUM, PONS, MEDULLA OBLONGATA, AND SPINAL CORD. ALSO FOUND
IN SKELETAL MUSCLE, WHERE IT IS LOCALIEDD BENEATH THE SARCOLEMA
OF FAST TWITCH MUSCLE FIBERS, AND IN SPLEEN, HEART, KIDNEY, AND
LIVER, N-NOS-1 AND N-NOS-2 ARE FOUND IN ALL PARTS OF THE NERVOUS
SYSTEM. NNOS BETA AND GAMMA OCCUR IN A REGION-SPECIFIC MANNER IN
THE BRAIN AND NNOS BETA EXPRESSION IS DEVELOPMENTALLY REGULATED.
NNOS MU IS ONLY FOUND IN MATURE SKELETAL AND CARDIAC MUSCLES.
-I-INDUCTION: BY CHOLINERGIC AGONISTS ACTING AT INOSITOL PHOSPHATE-
LINKED MUSCARINIC RECEPPORS IN CARRIAC MYCOYTES.
-I-DOMAIN: THE PDZ DOMAIN IN THE N-TERMINAL PART OF THE NEURONAL
ISOFORM PARTICIPATES IN PROTEIN-PROFIEN INTERACTION, AND IS
RESPONSTBLE FOR TARGETING NNOS TO SYNAPTIC MEMBRANES IN WUSCLES.
-I-DISEASE: IN MDX MICE (MOUSE MODEL OF DISTROPHINOPATHY) THE
DYSTROPHIN COMPLEX IS DISRUPTED AND NNOS IS DISPLACED FROM
SARCOLEMAR AND ACCUMULATES IN THE CYTOSOL.
-I-SIMILARITY: BELONGS TO THE NOS FAMILY.
-I-SIMILARITY: CONTAINS 1 PDZ/DHR DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HEME (BY SIMILARITY).

MISSING (IN ISOFORM NNOS CAMMA).
                      SUBUNIT: HOMODIMER (BY SIMILARITY).
SUBCELLULAR LOCATION: IN SKELETAL MUSCLE, NNOS IS LOCALIZED
BENEATH THE SARCOLEMAN OF FAST-TWITCH MUSCLE FIBER BY ASSOCIATING
WITH THE DYSTROPHIN GLYCOPROTEIN COMPLEX.
ALTERNALIYE PRODUCTS: 5 ISOFORMS; N.NOS-1 (SHOWN HERE), N.NOS-2,
NNOS BETA, NNOS GAMMA AND NNOS MU/MUSCLE-SPECIFIC; ARE PRODUCED BY
ALTERNATIVE SPLICING.

                                             THE ENZYME (BY STMILLARITY)

-1- ENZYME REGILATION: STIMULATED BY CALCIUM/CALMODULIN. INHIBITED BY
N-NOS-INHIBITING PROPERN (FIN) WHICH MAY PREVENT THE DIMERIZATION
OF THE PROTEIN (BY SIMILARITY).
-1- SUBGUNIT: HOMODIMER (BY SIMILARITY).
-1- SUBGLIULAR LOCATION: IN SKELETAL MUSCLE, NNOS IS LOCALIZED
BENEATH THE DYSTROPHIN GLYCOPROTEIN COMPLEX (BY SIMILARITY).
-1- ALTERNATIVE PRODUCES: 3 ISOFORMS, N-NOS-1 (SHOWN HERE), N-NOS-2
AND PRINOS: ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- TISSUE SPECIFICITY: ISOFORM N-NOS1 IS EXPRESSED IN BRAIN. ISOFORM
HONOS IS EXPRESSED IN THE PENIS, URETHRA, PROSTATE, AND SKELETAL
MUSCLE, AND CORXISTS WITH THE CREBELLAR NNOS IN THE PELVIC
PLEXUS, BLADDER AND LIVER, AND IS DETECTABLE IN THE CEREBELLUM.
-1- DOMAIN: THE PDZ DOMAIN IN THE N-TERMINAL PART OF THE NEURONAL
ISOFORM PARTICIPATES IN PROTEIN-PROTEIN INFERACTION, AND IS
RESPONSIBLE FOR TARGETING NNOS TO SYNAPTIC MEMBRANES IN MUSCLES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY).

HEME (BY SIMILARITY).

CARBOXYLATE OF THE SUBSTRATE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    780
                                                                                                                                                                                                                                                                          9
                                           The present sequence represents a cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono or poly-cyclic aromatic heterocyclics containing nitrogen, sulpiur or oxygen; optionally substituted mono or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cyclohrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidise many other substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                         121 DIAVQLVQKWERLNADEHIEVPEDWTRLTLDTIGLCGFNYRFNSFYRDQPHPFITSMVRA

This invention describes a novel electron donor system (M1) that transfers electrons to an enzyme with redox properties comprising an inventionation to telectrode-bound, electron sink and a mediator which enable the electron transfer. The invention also describes (1) transferring (M2) oxygen to a hydrocarbon containing hydrogen donor molecule is in a reaction mediator where the hydrogen donor molecule is in a reaction mediatus comprising the oxygen transferring enzyme and (M1) in the presence of oxygen and incubating under suitable reaction conditions; (2) the enzymatic production (M3) of terminally or subterminally hydroxylated (position omega-1 to omega-4) catty acids comprising; (i) mixing a hydroxylatable fatty acid or fatty acid derivative in the presence of (M1) and oytochrome P450 monooxygenase; and (ii) isolating the hydroxylated product; (3) a monooxygenase; and (11) isolating the hydroxylated fatty acids as described in (2); and (4) detecting (M4) fatty acid-monooxygenases
                                                                                                                                                                                       1020

        label in (M1); and (ii) qualitatively or quantitatively detecting the signal. The invention is useful for the production of omega-hydroxylated fatty acids and the detection of fatty acid monoxygenases. The invention provides an alternative electron donor system of enzymes with redox properties that is cheaper and more efficient, where the enzyme

This invention describes a novel modified cytochrome P450 (I) having, as a result of site-specific mutagenesis of its substrate-binding domain, an altered substrate profile, relative to the wild-type, when used for terminal and/or subterminal enzymatic hydroxylation of aliphatic carboxylic acids. The invention also describes (1) nucleic acid (II) candoing (I), and its complement, (2) expression assette (EC) containing (II) and control elements; (3) a vector containing at least one EC; (4) recombinant microorganisms transformed with at least one vector of (3); and (5) enzymatic production of terminally and/or subterminally (3); dydroxylated aliphatic carboxylic acids (A) using the microorganisms of (4), or isolated (I). (I), and recombinant cells that express them, are used to produce hydroxylated aliphatic carboxylic acids or their especially for hydroxylation of 8-12c fatty acids at the omega-1, cand/or 3 positions, and may also have increased reactivity and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Process for oxidizing acyclic or cyclic terpenes, cycloalkenes, or derivatives for preventing or treating infection in human or animal body comprises mutant haem-containing enzyme which has substitution of amino acid in the active site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes a process for oxidizing an acyclic or cyclic terpene, a cycloalkene, or a derivative. The process comprises oxidizing the compound with a mutant haem-containing enzyme which comprises a substitution of an amino acid in the active site by an amino acid with a less polar side-chain. The process is useful for oxidizing an acyclic or cyclic terpene, a cycloalkene, or their derivatives. The process is also useful for product useful for preventing or treating infection in a human or product useful for preventing or treating infection in a human or animal body. The present sequence represents the amino acid sequence of the process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 TIKEMPQPKTFGELKNLPLLNTDKPVQALMKIADELGEIFKFEAPGRVTRYLSSQRLIKE

Cytochrome P450 monooxygenase; oxidization; indole; indigo; indorubicin
                                                                                                                                                                                                                                                               The present sequence represents a cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen, optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              248
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a modified cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkanes are specifically used to oxidize indole to indigo and indorublcin. However, they may be used to oxidise many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      309 KQLKYVGMVLNEALRLWPTAPAFSLYAKEDTVLGGEYPLEKGDELMVLIPQLHRDKTIWG 368

                                                                                                                                                                                                                                                                                                                                                                                                                                          음
                                                                                                                                                                                                The present invention relates to a process for enzymatically oxidising the halogenated aromatic compounds such as 1,2-dichlorobenzene, 1,2,4-trichlorobenzene, 3,3'-dichlorobiphenyl or 2,2',4',5', 5'-fortichlorobenzene, 3,3'-dichlorobiphenyl or 2,2',4',5', 5'-fortichlorobiphenyl. The process comprises treating the polluted environment with a monooxygenase enzyme. A monooxygenase enzyme, P450cam, and its physiological electron transfer partners, putidaredoxin and putidaredoxin reductase, are used to oxidise the halogenated aromatic compounds. Also mutants of the monooxygenase enzyme with substitutions in the active site have enhanced oxidation activity. The process and the transgenic plant or animal which expresses the monooxygenase enzyme are used for detoxifying the environment polluted with the halo aromatic compounds. The present sequence is a Bacillus megaterium monooxygenase enzyme, P450BM-3, which is homologous to the monooxygenase

These degenerate primers are based on conserved sequences in known cytrochrome-P450-oxidoreductases. The DNA sequence of an isolated clone, given in AAQ79914, encodes a cytochrome-P450-oxidoreductase having the sequence given in AAR66738.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant DNA mol. encoding cytochrome P450 oxido:reductase esp. isolated from filamentous fungi, useful for increasing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides an isolated, mutated Monoamine Oxidase B (MAO B) enzyme having at least one amino acid substitution for wild-type amino acids in a MAO B active site, the wild-type amino acid residues selected from Phe423, Glu427 and Thr428. A plasmid containing the DNA encoding the mutated MAO B and regulatory elements can be used for the recombinant regulation of the enzyme. The mutated MAO B enzyme is useful for indirect regulation of cellular neurotransmitters and vascamines, as the substitutions reduce MAO B's activity and alters its PH profile. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to DNA sequence AAF29129 which encodes a human reductase represented in AAB49682. The DNA sequence shows homology with nucleotide sequences of cytochrome p450 reductases and nitric oxide synthases. The protein is related to members of the FNR gamily of synthases. The protein is related to members of the FNR gamily of lavoproteins. This reductase gene maps to human chromosome 9. The reductase polypeptide are useful in screening assays, particularly as diagnostic reagents for detecting abnormally decreased or increased levels of the reductase polypeptide or mRNA expression. In particular, these are useful for diagnosing or determining susceptibility of a subject to a disease associated with altered levels of reductase include cancer, and the sequences may be used in methods for drug bloactivation. The polypeptides and polynucleotides may also be used as vaccines to protect an individual against these diseases. The polypeptide or its fragments are also useful as immunogens to produce antibodies that are immunospecific for the reductase polypeptides. The polypeptide are immunospecific for the reductase polypeptides. The polypeptide are immunospecific for the reductase polypeptides. The polypeptide are immunospecific for the reductase polypeptides. The polyputice and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

This invention describes a novel method for the production of 2-(4-hydroxyphenoxy) propionic acid (1) from 2-phenoxypropionic acid (POPS) or its sails. The method comprises a microorganism containing at least one of the genes contained within a Beauverial bassiana genomic sequence of 11292 bp (I), with two open reading frames. (I) is useful as a herbicide intermediate. Microorganisms containing multiple copies of (I) have significantly increased hydroxylation rates. This sequence represents the Beauveria bassiana POPS reductase described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytochrome P450 monooxygenase; cytochrome P450 reductase; NPR; pigment production; indole; dye; cosmetic industry; marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                Production of 2-(4-hydroxyphenoxy) propionic acid from 2-phenoxypropionic acid using microorganism having increased hydroxylation rate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Devoss J, Guengerich FP, Volkov A;

PT Generation of genetically modified cell to produce pigment

XX

Claim 39; Page 145-148; 178pp; English.

XX

The present sequence is cytochrome P450 reductase. The invention

CC cytochrome P450 sequences. It involves the use of genetic material

CC encoding a cytochrome P450 protein or a functional derivative or

CC chomologue of it in the generation of a genetically modified coll

CC claim has the capacity to produce a pigment in the presence of indole,

CC or a precursor, analogue or derivative of indole, upon expression of

CC the genetic material. Pigment from plant or plant material is useful

CC in the dye or cosmetic industry or as commercial tags or as markers for

XX

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2, Application US/08553279
Patent No. 5801024
GENERAL INFORMATION:
APPLICANT:
TITLE OF INVENTION: No. 5801024el oxidoreductase from filamentous funghi,
TITLE OF INVENTION: DNA coding therefore and cells transformed with said DNA.
NUMBER OF SEQUENCES: 9
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
